AI Tool Overview

Recraft AI is a design tool with artificial intelligence to make vector drawings, illustrations, icons, and digital designs. Using text questions, it helps designers make visual assets quickly. A lot of people use the site for branding, marketing graphics, graphic design, and making digital media.

As a Media and Technology student, I find visual communication and digital design tools very useful. Recraft AI lets users make illustrations that look like they were made by a professional by following simple steps. This makes it useful for content creation, visual design, and branding. I picked this tool to look into how prompt quality affects the pictures that AI makes.

Original Prompt

"Create an illustration about the importance of WiFi."

AI-Assisted Prompt

ChatGPT

"Create a modern flat-style vector illustration that represents the importance of WiFi in everyday life. Show people in different situations, such as students studying online, a person working on a laptop, and someone using a smartphone for communication. Include visual elements like WiFi signal icons, routers, laptops, smartphones, and cloud connections. Use vibrant colors, clean lines, and a balanced composition suitable for a technology or digital connectivity campaign poster."

Comparison and Analysis

When using the original prompt instead of the AI-assisted question, the outputs made by Recraft AI were very different. Since the prompt was short and general, the illustration that was made was also easy. The picture still showed knowledge, but the design was missing some important visual elements and details. The AI tool had to take the prompt in a broad sense, which led to a simple picture with a classroom theme that didn't have much visual storytelling or symbolism.

The AI-assisted prompt, on the other hand, created a much more detailed and refined result. The directions were made clearer and more organized by using ChatGPT to improve the prompt. The better suggestion said what kind of illustration it was (modern flat-style vector), what kinds of visual elements it had (students, laptops, books, graduation caps, and light bulbs), and what kind of color scheme it had (bright colors and clean lines). With this extra help, the AI tool was able to make a design that was more interesting to look at and had more value.

Another difference was how the images were put together and how relevant they were. The better idea led to a more balanced drawing that looked like it would work on a poster for an educational campaign. Having images like light bulbs and graduation caps around helped get the idea of learning and knowledge across more clearly. On the other hand, the original work only showed a school scene and didn't make the point of how important education is in a bigger sense.

The improved prompt made things clearer, more in-depth, and more relevant. By choosing the style of the design and adding several educational features, the final

product was more in line with what was meant to be said. This shows that the quality of the prompts is a very important part of teaching AI tools how to do better work.

I learned that quick engineering is important when dealing with AI tools from this activity. A well-structured prompt with clear directions, background information, and the styles that are wanted can make AI outputs much better. Users should not give unclear instructions; instead, they should be very clear about what they want to happen. In turn, this helps the AI understand the job better and come up with more accurate, useful, and relevant results.
